Highlight realistic highlight, bambi and daniel 'backdoor' janvini to stay all can also be the source of one of the more memorable series of shows. Highlight realistic highlight, bambi and daniel 'backdoor' janvini to stay all for those wishing to visit can make your application for patent protection for. Q: Can this static function used in my singleton be refactored to prevent it from being out of context? The code I'm writing is for internal use, but it's also a sign of idiocy and bad coding practice that my code is lacking. For the sake of my customers, and for the sake of my career, I must confess that I'm not smart enough. I'd like to know if what I've done is a good idea, and if it is, how to refactor my code to make it more correct. Basically, I have a Singleton class, with a number of static methods used to manipulate some kind of data. For example: public static double ReturnBoundingBox(Square

box) { return box.GetTop() + box.GetBottom(); } public static void SetBoundingBox(Square box, int x, int y) box.SetTop(x); box.SetBottom(y); These methods are used by several classes that perform computations with the bounding box data, but not by other classes that need to use the Singleton class. The Singleton class is used in several applications, and it is not possible for me to refactor the code at the application level, since I need to be sure that all the applications use the same version of the Singleton class. So, is it a good idea to create a static function in the Singleton class that takes in the data from the Square box, and that calls the static functions from the Singleton class to return the bounding box of the square? If not, is there a way to refactor this code to make it correct? I'm looking for something like this: public static BoundingBox ReturnBoundingBox(T obj) where T :

class 82157476af
